1.

Suppose a MAC system (S,V) is used to protect files in a file system

by appending a MAC tag to each file. The MAC signing algorithm  ${\cal S}$ 

is applied to the file contents and nothing else. What tampering attacks

are not prevented by this system?

Changing the last modification time of a file.

## 正确

The MAC signing algorithm is only applied to the file contents and does not protect the file meta data.

- Replacing the contents of a file with the concatenation of two files on the file system.
- Changing the first byte of the file contents.
- Replacing the tag and contents of one file with the tag and contents of a file from another computer protected by the same MAC system, but a different key.

2

Let (S,V) be a secure MAC defined over (K,M,T) where  $M=\{0,1\}^n$  and  $T=\{0,1\}^{128}$  . That is, the key space is K, message space is  $\{0,1\}^n$ , and tag space is  $\{0,1\}^{128}$ .

Which of the following is a secure MAC: (as usual, we use  $\parallel$  to denote string concatenation)

 $S'((k_1,k_2),\,m)=\big(S(k_1,m),S(k_2,m)\big)\quad\text{ and }$   $V'\big((k_1,k_2),m,(t_1,t_2)\big)=\big[V(k_1,m,t_1)\text{ and }V(k_2,m,t_2)\big]$  (i.e.,  $V'\big((k_1,k_2),m,(t_1,t_2)\big)$  outputs ``1" if both  $t_1$  and  $t_2$  are valid tags)

3.

Recall that the ECBC-MAC uses a fixed IV (in the lecture we simply set the IV to 0).

Week 3 — **Ripoblem**e**Set** e chose a random IV for every message being signed and include the IV in 8/10 分 (80%)  $_{\text{测验, 10 }}$  the tag. In other words,  $S(k,m) := (r, \ \mathrm{ECBC}_r(k,m))$ 

where  $\mathrm{ECBC}_r(k,m)$  refers to the ECBC function using r as the IV. The verification algorithm V given key k, message m, and tag (r,t) outputs ``1" if  $t=\mathrm{ECBC}_r(k,m)$  and outputs ``0" otherwise.

The resulting MAC system is insecure.

An attacker can query for the tag of the 1-block message m and obtain the tag (r,t). He can then generate the following existential forgery: (we assume that the underlying block cipher operates on n-bit blocks)

The tag  $(r \oplus m, t)$  is a valid tag for the 1-block message  $0^n$ .

#### 正确

The CBC chain initiated with the IV  $r\oplus m$  and applied to the message  $0^n$  will produce exactly the same output as the CBC chain initiated with the IV r and applied to the message m. Therefore, the tag  $(r\oplus m,\ t)$  is a valid existential forgery for the message 0.

$\bigcirc$	The tag $(r\oplus t,\ r)$ is a valid tag for the 1-block message $0^n.$

- The tag  $(m \oplus t, \ r)$  is a valid tag for the 1-block message  $0^n$ .
- The tag  $(r, t \oplus r)$  is a valid tag for the 1-block message  $0^n$ .

Suppose Alice is broadcasting packets to 6 recipients

# Week 3 - Broblem Sietcy is not important but integrity is.

8/10 分 (80%)

测验, 10 个问题

In other words, each of  $B_1,\dots,B_6$  should be assured that the

packets he is receiving were sent by Alice.

Alice decides to use a MAC. Suppose Alice and  $B_1,\dots,B_6$  all

share a secret key k. Alice computes a tag for every packet she

sends using key k. Each user  $B_i$  verifies the tag when

receiving the packet and drops the packet if the tag is invalid.

Alice notices that this scheme is insecure because user  $B_1$  can

use the key k to send packets with a valid tag to

users  $B_2, \dots, B_6$  and they will all be fooled into thinking

that these packets are from Alice.

Instead, Alice sets up a set of 4 secret keys  $S = \{k_1, \dots, k_4\}$  .

She gives each user  $B_i$  some subset  $S_i \subseteq S$ 

of the keys. When Alice transmits a packet she appends 4 tags to it

by computing the tag with each of her 4 keys. When user  $B_i$  receives

a packet he accepts it as valid only if all tags corresponding

to his keys in  $S_i$  are valid. For example, if user  $B_1$  is given keys  $\{k_1,k_2\}$  he will accept an incoming packet only if the first and second tags are valid. Note that  $B_1$  cannot validate the 3rd and 4th tags because he does not have  $k_3$  or  $k_4$ .

How should Alice assign keys to the 6 users so that no single user

can forge packets on behalf of Alice and fool some other user?

### 正确

Every user can only generate tags with the two keys he has.

Since no set  $S_i$  is contained in another set  $S_i$ , no user i

can fool a user j into accepting a message sent by i.

5.

Consider the encrypted CBC MAC built from AES. Suppose we

compute the tag for a long message m comprising of n AES blocks.

Let m' be the n-block message obtained from m by flipping the

last bit of m (i.e. if the last bit of m is b then the last bit

of m' is  $b \oplus 1$ ). How many calls to AES would it take

to compute the tag for m' from the tag for m and the MAC key? (in this question please ignore message padding and simply assume that the message length is always a multiple of the AES block size)

4

#### 正确

You would decrypt the final CBC MAC encryption step done using  $k_2$ ,

the decrypt the last CBC MAC encryption step done using  $k_1$ ,

flip the last bit of the result, and re-apply the two encryptions.

7.

Suppose  $H_1$  and  $H_2$  are collision resistant

# Week 3 - Problem Set pping inputs in a set M to $\{0,1\}^{256}$ .

8/10 分 (80%)

测验, 10 个问题

Our goal is to show that the function  $H_2(H_1(m))$  is also

collision resistant. We prove the contra-positive:

suppose  $H_2(H_1(\cdot))$  is not collision resistant, that is, we are

given  $x \neq y$  such that  $H_2(H_1(x)) = H_2(H_1(y))$  .

We build a collision for either  $H_1$  or for  $H_2$ .

This will prove that if  $H_1$  and  $H_2$  are collision resistant

then so is  $H_2(H_1(\cdot))$ . Which of the following must be true:

 $igcup ext{Either } x,y$  are a collision for  $H_1$   $igcup ext{or}$ 

 $H_1(x), H_1(y)$  are a collision for  $H_2$ .

正确

If 
$$H_2(H_1(x))=H_2(H_1(y))$$
 then

either  $H_1(x)=H_1(y)$  and x
eq y , thereby giving us

a collision on  $H_1$  . Or  $H_1(x) 
eq H_1(y)$  but

 $H_2(H_1(x))=H_2(H_1(y))$  giving us a collision on  $H_2.$ 

Either way we obtain a collision on  ${\cal H}_1$  or  ${\cal H}_2$  as required.

- Either x,y are a collision for  $H_1$  or x,y are a collision for  $H_2$  .
- $igcap ext{Either } x,y$  are a collision for  $H_2$   $igcap ext{ or }$

 $H_1(x), H_1(y)$  are a collision for  $H_1$  .

Either  $H_2(x), H_2(y)$  are a collision for  $H_1$  or x,y are a collision for  $H_2$ .

In this question you are asked to find a collision for the compression function:

# Week 3 - $\mathbb{P}_1$ (o,b) lema $\mathbf{Se}(y,x) \oplus y$ .

8/10 分 (80%)

测验, 10 个问题

where  $\operatorname{AES}(x,y)$  is the AES-128 encryption of y under key x.

Your goal is to find two distinct pairs  $(x_1,y_1)$  and  $(x_2,y_2)$  such that  $f_1(x_1,y_1)=f_1(x_2,y_2)$  .

Which of the following methods finds the required  $(x_1, y_1)$  and  $(x_2, y_2)$ ?

Choose  $x_1,y_1,y_2$  arbitrarily (with  $y_1 \neq y_2$  ) and let  $v := AES(y_1,x_1)$  .

Set 
$$x_2 = AES^{-1}(y_2,\ v \oplus y_1 \oplus y_2)$$

You got it!

Choose  $x_1,y_1,y_2$  arbitrarily (with  $y_1 
eq y_2$  ) and let  $v := AES(y_1,x_1)$  .

Set 
$$x_2 = AES^{-1}(y_2,\ v \oplus y_1)$$

Choose  $x_1,y_1,x_2$  arbitrarily (with  $x_1 
eq x_2$  ) and let  $v := AES(y_1,x_1)$  .

Set 
$$y_2 = AES^{-1}(x_2, \ v \oplus y_1 \oplus x_2)$$

Choose  $x_1,y_1,y_2$  arbitrarily (with  $y_1 
eq y_2$  ) and let  $v := AES(y_1,x_1)$  .

Set 
$$x_2=AES^{-1}(y_2,\ v\oplus y_2)$$

1/1分

9.

Repeat the previous question, but now to find a collision for the compression function  $f_2(x,y) = \text{AES}(x,x) \bigoplus y$ .

Which of the following methods finds the required  $(x_1, y_1)$  and  $(x_2, y_2)$ ?

 $igcup Choose \ x_1, x_2, y_1 \ ext{ arbitrarily (with } x_1 
eq x_2$  ) and set

$$y_2 = y_1 \oplus AES(x_1, x_1)$$

Choose  $x_1, x_2, y_1$  arbitrarily (with  $x_1 \neq x_2$  ) and set

$$y_2=y_1\oplus AES(x_1,x_1)\oplus AES(x_2,x_2)$$

Awesome!

Choose  $x_1, x_2, y_1$  arbitrarily (with  $x_1 
eq x_2$  ) and set

$$y_2=y_1\oplus x_1\oplus AES(x_2,x_2)$$

Choose  $x_1, x_2, y_1$  arbitrarily (with  $x_1 
eq x_2$  ) and set

$$y_2 = AES(x_1, x_1) \oplus AES(x_2, x_2)$$

## Week 3 - Problem Set

8/10 分 (80%)

测验, 10 个问题

10.

Let  $H:M\to T$  be a random hash function where  $|M|\gg |T|$  (i.e. the size of M is much larger than the size of T).

In lecture we showed

that finding a collision on H can be done with  $Oig(|T|^{1/2}ig)$ 

random samples of H. How many random samples would it take

until we obtain a three way collision, namely distinct strings x,y,z

in M such that H(x) = H(y) = H(z) ?

 $O(|T|^{2/3})$ 

## 正确

An informal argument for this is as follows: suppose we

collect n random samples. The number of triples among the n

samples is n choose 3 which is  $O(n^3)$ . For a particular

triple x,y,z to be a 3-way collision we need H(x)=H(y)

and H(x) = H(z). Since each one of these two events happens

with probability 1/|T| (assuming H behaves like a random

function) the probability that a particular triple is a 3-way

collision is  $O(1/|T|^2)$ . Using the union bound, the probability

that some triple is a 3-way collision is  $O(n^3/|T|^2)$  and since

we want this probability to be close to 1, the bound on n

follows.

- $O(|T|^{1/2})$
- O(|T|)
- $O(|T|^{1/3})$
